

Compilation Error from Lاسernet FO Connector 6.17

Kate Coles - 2023-12-01 - Comments (0) - Lاسernet FO Connector FAQs

Lasernet for Dynamics 365

Customers that have developed code to initialize Lاسernet reports in Lاسernet FO Connector prior to version 6.17, will get a compilation error when they upgrade to Lاسernet FO Connector 6.17 because report initialization from the code has changed in this version.

Error

Type mismatch in 'LACRunQueryServiceController.newReport' argument 2. The expected type is 'LACArgsCache', but the actual type is 'boolean'.

Lاسernet FO Connector 6.17 contains major enhancements related to performance. One of the newly introduced features is a new logic for the cache. This change affects the way the report is initialized and processed from the code.

It might be required that some customers having custom code to launch Lاسernet reports have to update the code.

The Lاسernet tutorial is also updated to give users an understanding of using Lاسernet features from the code. **LACTutorialStartReport** shows the changes that might be required to follow.

Older Lاسernet FO Connector version:

Lasernet FO Connector 6.17:

Code fragment to initialize **LACRunQueryServiceController**:

```
LACRunQueryServiceController controller =  
LACRunQueryServiceController::newReport("LACCustTable",  
LACArgsCache::newCache('LACCustTable'), true);
```

In case there is no Report in the scope/context of the process, LACArgsCache should be initialized with an empty string:

```
LACArgsCache argsCache = LACArgsCache::newCache("");
```

The following is an example that should be followed:

The updated tutorial model has been added to the Lasernet FO Connector 6.17.1 release.
