

How to connect to a PostgreSQL database in Lasernet

Mikael Wängelin - 2021-08-25 - Comments (0) - Lasernet General Information

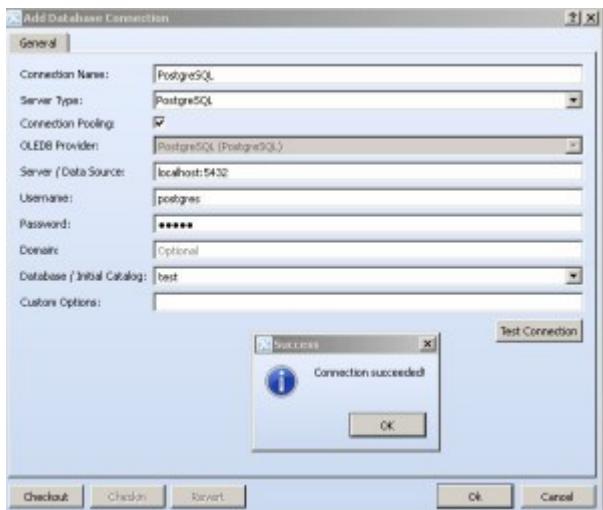

Lasernet

Lasernet 6.7 or above needs to have an external driver to use a **PostgreSQL** database connection. Follow these steps:

1. Find the `libpq.dll` and `libintl-8.dll` files from inside the *PostgreSQL* installation folder.
 2. This file then needs to be placed into the main installation folder of Lasernet.
 3. After copying, restart the Lasernet service and reopen the Lasernet Developer.
- 64-bit Lasernet 6.7 and above requires 64-bit drivers.
4. Define the PostgreSQL path in Environment Variables: `%PGR0OT%\bin`.
 5. To get a connection with PostgreSQL installed on the same server as Lasernet, the fields below need to be set:

6. Click the **Test Connection** button to verify the setting. If every field is correct then you will have the message "Connection succeeded!" as below:

This connection can be saved and then referenced in Database Commands.
