

How to convert the Excel input to XML within Lاسernet

Mikael Wängelin - 2022-10-26 - Comments (0) - Lاسernet General Information

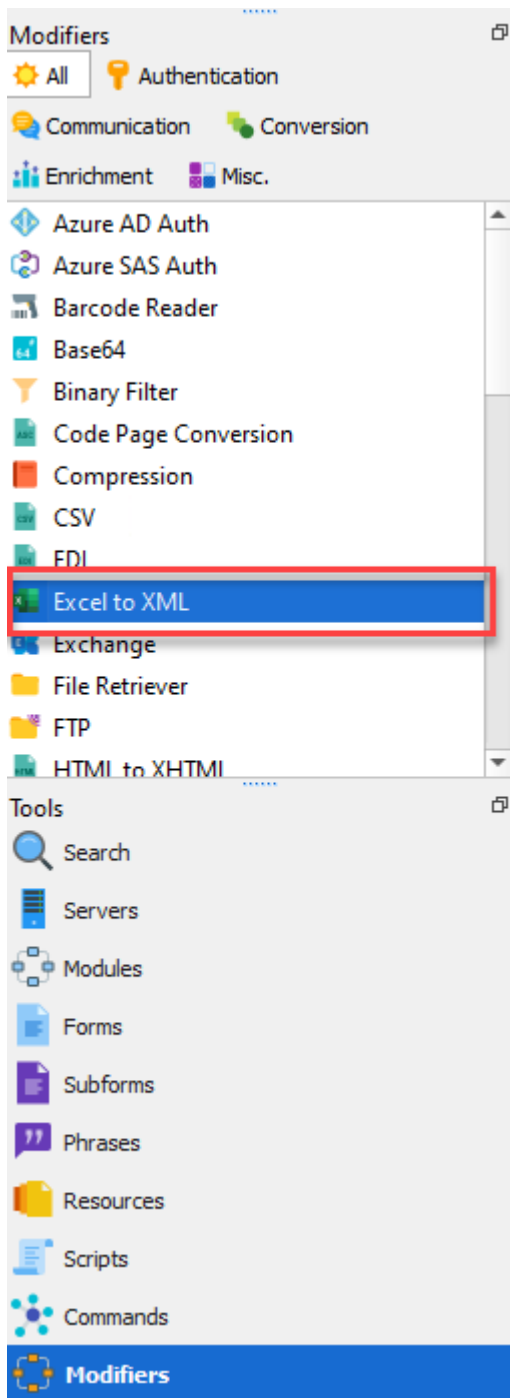

Lاسernet

This article describes how to set up a modifier for converting Excel input (.xls/.xlsx) to XML within Lاسernet 9 or later.

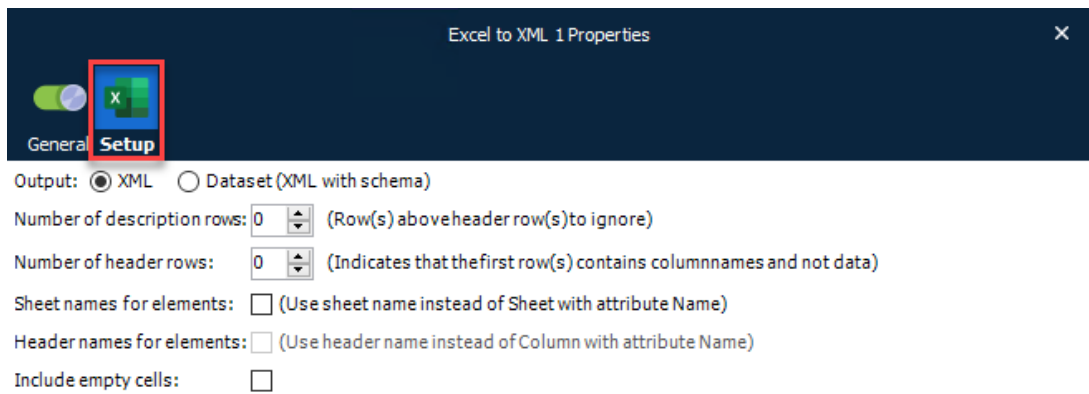

The following form configurations require Input, Form Engine, and Output modules.

Setting up an Excel to XML modifier

1. Open Lاسernet Developer.
2. Select **Modifiers** in the Tools menu.
3. Double-click the **Excel to XML** modifier.

4. The *Excel to XML Properties* window will appear. Click the **Setup** tab to adjust the settings as required.

5. Apply the modifier to a module, such as Form Engine Enter Modifier or File Input.

This modifier can now be used to convert the input into an XML format to be processed by forms with an XML input set. This will enable you to set the Description and Header rows to **Ignore**.
