How do I Enable the Missing Table Generator feature?

- 2023-11-30 - Comments (0) - Lasernet FO Connector FAQs

Lasernet for Dynamics 365

Introduction

The Missing Table Generator feature was introduced in Dynamics 365 Finance and Operation 6.7.0. This feature provides an option to automatically generate any missing tables and fields in the user's environment, for development and debugging purposes.

It can be useful to users who work with highly customized tables and fields, and when importing reports from the customer's environment to the 'non-customer's' environment, where fields and/or tables are missing.

Enable the feature

To enable the Missing Table Generator feature, follow these steps:

1. In Finance and Operations, navigate to **Lasernet** > **Setup** > **Parameters**.

2. Open the **Performance** tab and expand the Check if Lasernet module is compatible with current system section.

3. Toggle the **Enable missing table generator for imported reports** option to **Yes**.

Note

This makes the option available also in the Lasernet report overview.

If any fields and/or tables are missing, a ZIP file is created and downloaded to the machine. The ZIP file includes some XML file and an automatically generated `Readme.txt` explaining how to apply the missing fields and/or tables in the environment.

Readme.txt

The ZIP file contains auto-generated missing tables from the `ReportWithMissingTableAndFields` report. To install these generated tables and fields, please follow these steps:

1. Create a new package and ensure you add references to the `ApplicationSuite` packages.

2. Within the new package, create the `AxTableExtension` folder, and add to it the following files:

- `CardTrans.LACTMPExtension.xml`

- `CustInvoiceJour.LACTMPExtension.xml`

- `CustInvoiceTrans.LACTMPExtension.xml`

- `SalesLine.LACTMPExtension.xml`

3. Within the new package, create the `AxTable` folder and add to it the following file:

- LasernetTable.xml

4. Compile and synchronize the package.
