

Reporting Cluster (Fabric Hosting)

- 2023-11-30 - Comments (0) - Lاسernet FO Connector FAQs

Lasernet for Dynamics 365

Microsoft Dynamics 365 Finance and Operations uses a report cluster (fabric hosting) running via self-service. It was causing a different behavior between a DEV/1Box environment and a self-service environment.

Everything worked on the DEV/1Box environment, as expected, but it generated a wrong output of the XML file in the self-service environment. The original, unfixed version of the SSRS reports was used, and the Lاسernet Connector references could become empty. As a result, it was not possible to fetch these additional tables:

```
<FIELD_SalesConfirmDetailsTmp_LACTransRefRecId>0</FIELD_SalesConfirmDetailsTmp_LACTransRefRecId>
```

Version 6.5.0 contains an adjustment that ensures the same behavior in the DEV/1Box-environment as it is in the self-service environment.

The following feature was added to the previous version of D365 FO and is useful to ensure executing a report properly. The feature allows the preparation of the XML file which has the fixed report name as a part of the file name. Normally, the original SSRS report is to have the *LAC_Fix_xxxx* prefix.

An SSRS report without a precision design does not have the *LAC_Fix_xxxx*. It is not possible to fix any SSRS report if it does not have a precision design.

Running a report generates the XML file (only when using SSRS reports as the origin for Lاسernet, but not replacement reports).

The XML file is set using the following parameter:
