# SharePoint Output module sometimes fails when uploading files

- 2022-10-13 - Comments (0) - Lasernet Developer FAQs

This article is based on Lasernet 7/8 and SharePoint 2013.

The SharePoint Output module sometimes fails when uploading files. When files are small, the issue is rare, however, with larger files, there can be a failure, described by the following log:

'Failed to send HTTP request body'.

The cause is either SSL or the use of a reverse proxy(F5) between the Lasernet server and the SharePoint server. We recommend using HTTP (not SSL) and no reverse proxy to resolve this issue.
