

On Demand: Lاسernet Version 10.1 Release Overview

2021-10-13 - Alex Clemons - Comments (0) - Formpipe Webinars

Lاسernet

Thursday 14th October 2021 saw another excellent walkthrough of the latest release notes of Lاسernet version 10.1. We are pleased to report that we have had some positive feedback from the webinar and would like to share some of the questions and answers that were covered during the session, along with the recorded webinar and some useful links.

Questions and Answers

The following questions and answers were covered by our product experts during the session:

Are there any changes/improvements to Version Control?

There is integration to the new Dependency Walker (a preview of this is visible within the webinar recording).

During import, you can make a "Show changes" and compare an existing object with the

imported object.

Can we now use FollowMe printing (shared queue using AD credentials from D365FO)?

Yes, just using the username. See this guide: [D365 FO User Guide - undefined \(formpipe.com\)](#)

For version control I'm mainly missing branches/shelvesets and more transparency regarding the history of changes performed. But using different configurations per branch/release works so far.
We will not be able to merge, which is a monster - especially when talking about Forms.

Is there a way to "Show Changes" on Forms and not only see a changed binary?

No sorry, currently the Diff Dialog does not support Forms in dept. Forms are huge and complex, so it's not a trivial feature to add, in a way that is also understandable and user-friendly.

Are you able to set up the timeframe for the Monitor performance, like From Mon - Friday?

No, the current version only records 24 hours. In the future, we will add support for saving longer periods in a database, for example, up to 3 months.

I'm missing the email notification feature in Client for specific modules, for example for failed emails or PDF merging errors. Could we have something out of the box on Client?

It's not a feature on the drawing board, but you can actually set it up today by using a Failure-Destination on the Output Module and then pass the Job to an Email Output Module which sends an email with details about the problem.
