

Vulnerability in the Client Web Service of Lasetnet 9 and older

2022-01-07 - Jason Gillan - Comments (0) - Lasetnet News

Lasetnet

During a Penetration test of Lasetnet, it was identified that there is a potential file inclusion vulnerability within one of the Client Web Services in Lasetnet 9 and below.

This vulnerability is not present in Lasetnet 10, and will be patched in Lasetnet 9.13.3 due out next week (week starting 10th January 2022).

This vulnerability requires the Client to be enabled within the Lasetnet Configuration, the attacker to have access to that endpoint and for there to be no authentication set or for the attacker to have the authentication details already.

We strongly recommend everyone upgrades to Lasetnet 10 or Lasetnet 9.13.3

once it is released, however, if they are unable to upgrade but still want to remove or reduce the chance of this vulnerability getting exploited, then there are additional options that can be used, as follows:

- Disable the Client in the Lasetnet Configuration
 - This will disable the endpoint that the vulnerability initially required
 - This will also disable the use of the Lasetnet Client
- Secure access to the Client port via IP whitelisting in the Firewall
 - This means that only whitelisted IPs can access the Client endpoint, so the potential attacker would have to be from an approved address
- Add in Authentication
 - If "Basic Authentication + SSL Encryption" is used, it means the attacker would need to possess the credentials needed to access that endpoint and will be unable to intercept them from unsecured traffic
 - This doesn't prevent attackers with access to the Lasetnet credentials already from performing the attack

Any or all of those above methods can help protect the affected endpoint, although the best way to ensure security of the system is to perform frequent updates to ensure the latest security patches are always applied.
